Experiment No. 10: Performance Optimization in Zoho Creator

1. AIM

To study and implement performance optimization techniques in Zoho Creator applications.

2. THEORY

Performance optimization improves the speed, responsiveness, and efficiency of an application. In Zoho Creator, optimization techniques help reduce loading time and ensure smooth application execution.

Key techniques include:

- **Optimizing Deluge Scripts:** Avoid unnecessary calculations and repeated operations.
- **Efficient Data Retrieval:** Fetch only the required records and fields.
- **Optimizing Reports:** Use suitable filters and avoid displaying excessive data.
- **Reducing Workflows:** Avoid unnecessary workflow triggers and redundant actions.
- **Improving Form Design:** Use simple layouts and necessary fields only.

3. PROCEDURE

1. Log in to Zoho Creator and open the application.
2. Identify forms, reports, and workflows that may affect performance.
3. Review Deluge scripts and remove unnecessary operations.
4. Apply suitable filters to retrieve only the required records.
5. Optimize reports by displaying relevant fields and limiting unnecessary data.
6. Review workflow rules and eliminate redundant triggers.
7. Test the application before and after optimization.
8. Compare loading time and responsiveness to evaluate improvements.

4. APPLICATION

In a Vehicle Service Management application, filters can display only relevant service requests, optimized scripts can reduce processing time, and simplified reports can improve usability.

5. RESULT

Performance optimization techniques in Zoho Creator were studied. Efficient scripts, data retrieval, reports, and workflows help improve application speed and responsiveness.
