Experiment No. 11: Application Deployment and Migration

1. AIM

To study the process of deploying and migrating applications in Zoho Creator.

2. THEORY

Application deployment is the process of making an application available to users. **Application migration** involves transferring an application and its components from one environment or account to another.

Zoho Creator provides features to publish applications, manage user access, and export or import application components.

Key concepts include:

- **Deployment:** Making the application accessible to intended users.
- **Migration:** Transferring application components between environments.
- **Testing:** Verifying forms, reports, workflows, and integrations before deployment.
- **Access Control:** Configuring permissions for authorized users.
- **Data Backup:** Protecting application data before migration.

3. PROCEDURE

1. Log in to Zoho Creator and open the application.
2. Verify that all forms, reports, workflows, and scripts are working correctly.
3. Test the application using sample records.
4. Configure user roles and access permissions.
5. Use the available publishing options to make the application accessible to authorized users.
6. For migration, use the appropriate export or application-copy option available in Zoho Creator.
7. Import the application into the target environment, if supported.
8. Configure connections, permissions, and other environment-specific settings.
9. Test the deployed or migrated application to ensure proper functionality.

4. APPLICATION

A Vehicle Service Management application can be deployed for service centre employees and customers. Migration allows the application to be transferred to another supported environment while preserving its required components.

5. RESULT

Application deployment and migration in Zoho Creator were studied. The process helps make applications available to users and transfer application components between supported environments.
