Experiment No. 12: Security and Governance in Zoho Creator

1. AIM

To study security features and governance practices in Zoho Creator for protecting application data and managing access.

2. THEORY

Security and governance ensure that applications and their data are protected from unauthorized access. Zoho Creator provides access controls and security settings to manage users, permissions, and data.

Key features include:

- **User Authentication:** Verifies the identity of users before granting access.
- **Role-Based Access Control:** Assigns permissions based on user roles.
- **Data Security:** Protects sensitive information through access restrictions.
- **Audit Logs:** Help administrators monitor activities and track changes, where supported.
- **Data Privacy:** Ensures that users access only the information they are authorized to view.
- **Governance:** Establishes rules and policies for application development, usage, and maintenance.

3. PROCEDURE

1. Log in to Zoho Creator and open the required application.
2. Navigate to the user-management and permission settings.
3. Create or configure roles for administrators and regular users.
4. Assign appropriate permissions to forms, reports, and records.
5. Restrict access to sensitive information.
6. Explore available security settings and audit logs.
7. Test the application using different user accounts.
8. Verify that users can access only the features and data permitted by their roles.

4. APPLICATION

In a Vehicle Service Management application, administrators can manage all records, service managers can update repair details, and customers can access only their permitted service information.

5. RESULT

Security and governance features in Zoho Creator were studied. Access controls, permissions, and monitoring practices help protect application data and maintain secure application management.
